

Time saved is the input. Brand velocity is the outcome.

CORE PRINCIPLE
Faster to goal,
across more brands

01 The outcome ladder

Measured • modelled • correlational

T1
COMMERCIAL

Revenue influenced • leads converted
Pipeline and closed revenue from organic and AI-search sessions, read from the client's own CRM. What the retainer is judged on.

CORRELATIONAL

T2
PLATFORM

Share of voice • AI citations & mentions • impressions • clicks
Tracked as a time series, not a monthly snapshot — share of voice *rising over time* is the claim.

MEASURED

T3
VELOCITY *

Time-to-target • goal attainment rate
Weeks from goal-set to goal-hit, against a matched cohort of pre-Atlas accounts. Not "did SoV rise" but "did it rise *sooner*".

VS. COHORT

T4
LEVERAGE

Brands assisted per CSM • assist depth
Accounts held at cadence-compliant quality, and how many get a proactive recommendation rather than just a report.

MODELLED

T5
EFFORT

Minutes per approved report, decomposed by panel
The original four hours. Necessary to prove, insufficient to celebrate.

MEASURED

02 Time saved, by panel

In-app timer, per surface

01

Source panel
Pulling and checking raw data — the assembly the pipeline replaces.
Target → 0

02

Studio canvas
Editing the drafted narrative. Falling means draft quality is rising.
Falling = trust

03

Evidence panel
Verifying claims against source. Zero is rubber-stamping, not speed.
A floor, never zero

04

Approve & send
Last edit to decision — whether the CSM trusts what they are signing.
The residual

THE CHAIN — HOURS FREED BECOME BRANDS SERVED, BRANDS SERVED BECOME GOALS HIT SOONER

01

Hours freed
Assembly time leaves the report cycle.

02

Brands served
The same CSM holds more accounts at quality.

03

Goals hit sooner
Time-to-target falls against a matched cohort.

04

Visible proof
Share of voice and citations the client can see.

05

Retainer renewed
Revenue influenced, leads converted.
